

Support These Energy Amendments

#	10-Year Savings	Description
73	\$1 billion	This amendment eliminates the Clean Energy Standard Exiting, a program which provides handouts to the owners of large hydroelectric and nuclear plants to <u>no clear benefit to ratepayers or the climate</u> .
36	\$946 million	This amendment would make it harder for gas companies to pass on the costs of future contracts with the Everett Marine Terminal to their customers. This change is needed because <u>current law allows the owner of the terminal to charge above-market prices for its gas</u> , increasing rates.
47	\$250 million	This amendment would halve the size of the Class II Renewables Standard by removing power plants that joined after 2014.
75	\$558 million	This amendment would end the Alternative Energy Portfolio Standard, <u>a program which largely subsidizes natural gas-burning combined heat and power units</u> .
51	Uncertain.	This amendment addresses ongoing consumer protection issues in the residential solar market by mandating standardized pre-sale disclosures, creating a licensing system for businesses, and other policies. Similar language has already passed the House.
4	\$100 million	This amendment eliminates a financial incentive for transmission owners to be part of a regional transmission organization and replaces it with a requirement to do so.
1	Uncertain, likely significant.	This amendment directs the Department of Public Utilities to investigate reducing utilities return on equity and curbing their excess profits.
62	Uncertain, possibly significant.	This amendment would better regulate data centers, which can help ensure that their operation does not increase electricity costs for other customers, among other benefits.
